1 Introduction

You may have found yourself in a familiar predicament for many bioinformaticians: you have a lot of sequences and you need to *downsize* before you can get going. You may also *theorize* that this must be an easy problem to solve—given sequences, output clusters. But what can you *utilize* to solve this problem? This vignette will *familiarize* you with the `Clusterize` function in the DECIPHER package. Clusterize will *revolutionize* all your clustering needs! Why `Clusterize`?

- Scalability - `Clusterize` will *linearize* the search space so that many sequences can be clustered in a reasonable amount of time.
- Simplicity - Although you can *individualize* `Clusterize`, the defaults are straightforward and should meet most of your needs.
- Accuracy - `Clusterize` will *maximize* your ability to extract biologically meaningful results from your sequences.

This vignette will summarize the use of `Clusterize` to cluster DNA, RNA, or protein sequences.

2 Getting Started

To get started we need to load the DECIPHER package, which automatically *mobilize* a few other required packages.

```
> library(DECIPHER)
```

There's no need to memorize the inputs to Clusterize, because its help page can be accessed through:

```
> ? Clusterize
```

3 Optimize your inputs to Clusterize

Clusterize requires that you first digitize your sequences by loading them into memory. For the purpose of this vignette, we will capitalize on the fact that DECIPHER already includes some built-in sets of sequences.

```
> # specify the path to your file of sequences:
> fas <- "<path to training FASTA file>"
> # OR use the example DNA sequences:
> fas <- system.file("extdata",
  "50S_ribosomal_protein_L2.fas",
  package="DECIPHER")
> # read the sequences into memory
> dna <- readDNAStringSet(fas)
> dna
DNAStringSet object of length 317:

```

The Clusterize algorithm will generalize to nucleotide or protein sequences, so we must choose which we are going to use. Here, we hypothesize that weaker similarities can be detected between proteins and, therefore, decide to use the translated coding (amino acid) sequences. If you wish to cluster at high similarity, you could also strategize that nucleotide sequences would be better because there would be more nucleotide than amino acid differences.

```
> aa <- translate(dna)
> aa
AAStringSet object of length 317:
      width seq                                     names

```

```
> seqs <- aa # could also cluster the nucleotides
```

Now you can choose how to parameterize the function, with the main arguments being *myXStringSet* and *cutoff*. In this case, we will initialize *cutoff* at `seq(0.5, 0, -0.1)` to cluster sequences from 50% to 100% similarity by 10%'s. It is important to recognize that *cutoffs* can be provided in *ascending* or *descending* order and, when *descending*, groups at each *cutoff* will be nested within the previous *cutoff*'s groups.

We must also choose whether to customize the calculation of distance. The defaults will penalize gaps as single events, such that each consecutive set of gaps (i.e., insertion or deletion) is considered equivalent to one mismatch. If you want to standardize the definition of distance to be the same as most other clustering programs then set: *penalizeGapLetterMatches* to TRUE (i.e., every gap position is a mismatch), *method* to "shortest", *minCoverage* to 0, and *includeTerminalGaps* to TRUE. It is possible to rationalize many different measures of distance – see the *DistanceMatrix* function for more information about alternative parameterizations.

We can further personalize the inputs as desired. The main function argument to emphasize is *processors*, which controls whether the function is parallelized on multiple computer threads (if DECIPHER was built with OpenMP enabled). Setting *processors* to a value greater than 1 will speed up clustering considerably, especially for large size clustering problems. Once we are ready, it's time to run *Clusterize* and wait for the output to materialize!

```
> clusters <- Clusterize(seqs, cutoff=seq(0.5, 0, -0.1), processors=1)
Partitioning sequences by 6-mer similarity:

iteration 8 of up to 400 (100.0% coverage)

Time difference of 0.09 secs

Sorting by relatedness within 1 group:

iteration 51 of up to 51 (100.0% stability)

Time difference of 2.45 secs

Clustering sequences by 4-mer similarity:
=====

Clusters via relatedness sorting: 100% (0% exclusively)
Clusters via rare 4-mers: 100% (0% exclusively)
Estimated clustering effectiveness: 100%
Time difference of 0.39 secs
> class(clusters)
[1] "data.frame"
> colnames(clusters)
[1] "cluster_0_5" "cluster_0_4" "cluster_0_3" "cluster_0_2" "cluster_0_1"
[6] "cluster_0"
> str(clusters)
'data.frame':      317 obs. of  6 variables:
 $ cluster_0_5: int  4 4 4 4 4 4 4 3 3 3 ...
 $ cluster_0_4: int  1 6 6 6 4 4 4 10 10 10 ...
 $ cluster_0_3: int  53 38 38 38 45 45 42 30 30 30 ...
 $ cluster_0_2: int  1 24 24 24 12 12 16 35 35 35 ...
 $ cluster_0_1: int  87 54 54 54 69 69 64 42 42 42 ...
 $ cluster_0  : int  2 45 45 45 24 24 32 57 57 57 ...
```

```
> apply(clusters, 2, max) # number of clusters per cutoff
cluster_0_5 cluster_0_4 cluster_0_3 cluster_0_2 cluster_0_1 cluster_0
4          27          53          71          87          102
```

Notice that `Clusterize` will characterize the clustering based on how many clustered pairs came from relatedness sorting versus rare k-mers, and `Clusterize` will predict the effectiveness of clustering. Depending on the input sequences, the percentage of clusters originating from relatedness sorting will equalize with the number originating from rare k-mers, but more commonly clusters will originate from one source or the other. The clustering effectiveness formalizes the concept of “inexact” clustering by approximating the fraction of possible sequence pairs that were correctly clustered together. You can incentivize a higher clustering effectiveness by increasing `maxPhase3` at the expense of (proportionally) longer run times.

We can now realize our objective of decreasing the number of sequences. Here, we will prioritize keeping only the longest diverse sequences.

```
> o <- order(clusters[[2]], width(seqs), decreasing=TRUE) # 40% cutoff
> o <- o[!duplicated(clusters[[2]])]
> aa[o]

```

4 Visualize the output of Clusterize

We can scrutinize the clusters by selecting them and looking at their multiple sequence alignment:

```

> t <- table(clusters[[1]]) # select the clusters at a cutoff
> t <- sort(t, decreasing=TRUE)
> head(t)
  4   3   1   2
153 105  47  12
> w <- which(clusters[[1]] == names(t[1]))
> AlignSeqs(seqs[w], verbose=FALSE)
AAStringSet object of length 153:
      width seq
[1]    287 -MALKNFPITPSLRELQVQVDK...TR-KNKRTSKFIVKKRK----- Rickettsia prowaz...
[2]    287 -MGIRKLKPTTPGQRHKVIGAF...TRAPKKHSSKYIIERRKK----- Porphyromonas gin...
[3]    287 -MGIRKLKPTTPGQRHKVIGAF...TRAPKKHSSKYIIERRKK----- Porphyromonas gin...
[4]    287 -MGIRKLKPTTPGQRHKVIGAF...TRAPKKHSSKYIIERRKK----- Porphyromonas gin...

[152]   287 -MPIQKCKPTSPGRRFVEKVH...TR-TNKRTTKMIIRDRRVK--- Acinetobacter sp....
[153]   287 -MALKTFNPTTPGQRQLVMVDR...TR-SNKSTNKFILLSRHKRKK- Bradyrhizobium ja...

```

It's possible to utilize the `heatmap` function to view the clustering results.

As can be seen in Figure 1, `Clusterize` will organize its clusters such that each new cluster is within the previous cluster when *cutoff* is provided in descending order. We can also see that sequences from the same species tend to cluster together, which is an alternative way to systematize sequences without clustering.

```

> aligned_seqs <- AlignSeqs(seqs, verbose=FALSE)
> d <- DistanceMatrix(aligned_seqs, verbose=FALSE)
> tree <- TreeLine(myDistMatrix=d, method="UPGMA", verbose=FALSE)
> heatmap(as.matrix(clusters), scale="column", Colv=NA, Rowv=tree)

```

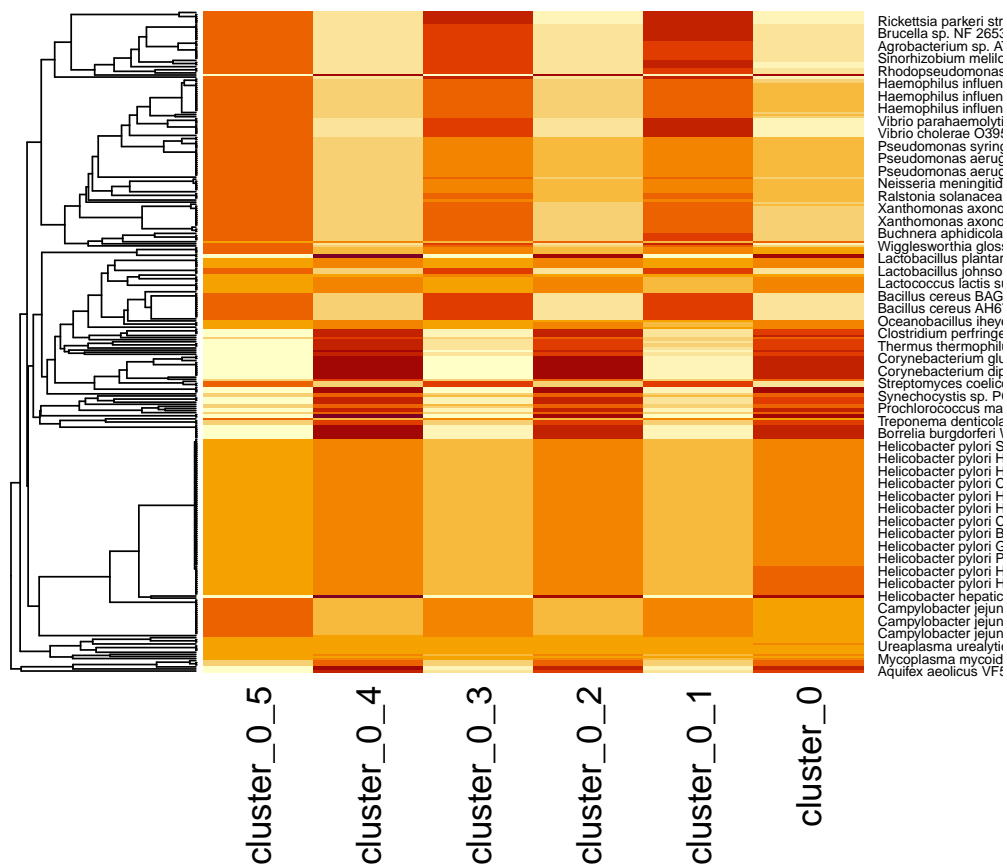

Figure 1: Visualization of the clustering.

5 Specialize clustering for your goals

The most common use of clustering is to categorize sequences into groups sharing similarity above a threshold and pick one representative sequence per group. These settings emipitomize this typical user scenario:

```
> c1 <- Clusterize(dna, cutoff=0.2, invertCenters=TRUE, processors=1)
Partitioning sequences by 9-mer similarity:

iteration 96 of up to 400 (100.0% coverage)

Time difference of 0.49 secs

Sorting by relatedness within 89 groups:

iteration 37 of up to 37 (100.0% stability)

Time difference of 1.15 secs

Clustering sequences by 9-mer similarity:
=====

Clusters via relatedness sorting: 100% (0% exclusively)
Clusters via rare 6-mers: 100% (0% exclusively)
Estimated clustering effectiveness: 100%
Time difference of 3 secs
> w <- which(c1 < 0 & !duplicated(c1))
> dna[w] # select cluster representatives (negative cluster numbers)
DNAStrngSet object of length 78:
      width seq
[1] 822 ATGGGAATACGTAAACTCAAGCC...CATCATTGAGAGAAGGAAAAAG Porphyromonas gin...
[2] 825 ATGCCATTGATGAAGTTCAAACC...CATCGTCCGCGATCGTAGGGGC Xanthomonas campe...
[3] 837 GTGGGTATTAAGAAGTATAAACC...TGGTCGCCGTCAGGCAAACAC Lactobacillus pla...
[4] 828 ATGGCAATTAAGAAGTATAAACC...CATTGTACGTCGTCGTAAAAAA Bacillus halodura...
[5] 828 ATGGGTATTCGTAATTATCGGCC...GATTGTCCGCCGTCGCACCAAA Synechocystis sp....
...
[74] 831 ATGGCATTTAAGCACTTTAATCC...TACGCGTCATCAGCGCAAGAAA Bartonella quinta...
[75] 843 ATGTTTAAGAAATATCGACCTGT...CGTGAAACGTCGAAGGAAGAAG Candidatus Protoc...
[76] 822 ATGCCTATTCAAAAATGCAAACC...TATTTCGCGATCGTCGCGTCAAG Acinetobacter sp....
[77] 864 ATGGGCATTTCGCGTTTACCGACC...GGGTCGCGGTGGTCGTCAGTCT Thermosynechococc...
[78] 840 ATGGGCATTTCGCAAATATCGACC...CAAGACGGCTTCCGGGCGAGGT Gloeobacter viola...
```

By default, Clusterize will cluster sequences with linkage to the representative sequence in each group, but it is also possible to tell Clusterize to minimize the number of clusters by establishing linkage to any sequence in the cluster (i.e., single-linkage):

```
> c2 <- Clusterize(dna, cutoff=0.2, singleLinkage=TRUE, processors=1)
Partitioning sequences by 9-mer similarity:

iteration 96 of up to 400 (100.0% coverage)

Time difference of 0.49 secs
```

Sorting by relatedness within 89 groups:

iteration 37 of up to 37 (100.0% stability)

Time difference of 1.19 secs

Clustering sequences by 9-mer similarity:

=====

Clusters via relatedness sorting: 100% (0% exclusively)

Clusters via rare 6-mers: 100% (0% exclusively)

Estimated clustering effectiveness: 100%

Time difference of 4.75 secs

> max(abs(c1)) # center-linkage

[1] 78

> max(c2) # single-linkage (fewer clusters, but broader clusters)

[1] 76

It is possible to *synthesize* a plot showing a cross tabulation of taxonomy and cluster number. We may *idealize* the clustering as matching taxonomic labels (2), but this is not exactly the case.

```

> genus <- sapply(strsplit(names(dna), " "), `[`, 1)
> t <- table(genus, c2[[1]])
> heatmap(sqrt(t), scale="none", Rowv=NA, col=hcl.colors(100))

```

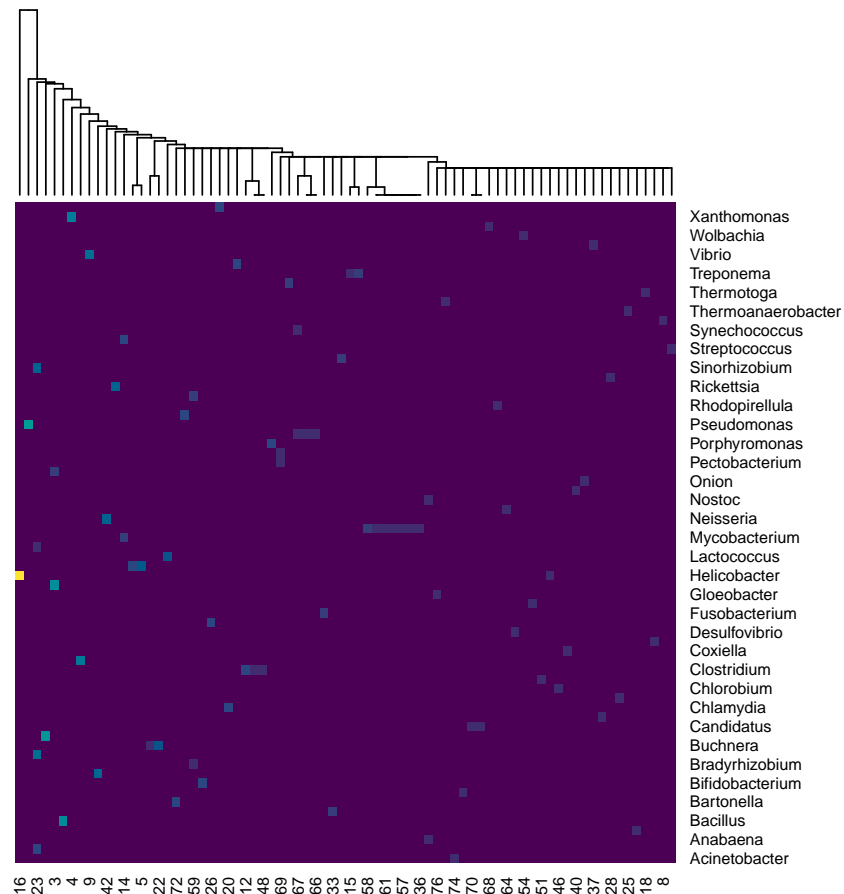

Figure 2: Another visualization of the clustering.

6 Finalize your use of Clusterize

Notably, `Clusterize` is a stochastic algorithm, meaning it will *randomize* which sequences are selected during pre-sorting. Even though the clusters will typically *stabilize* with enough iterations, you can set the random number seed (before every run) to guarantee reproducibility of the clusters:

```
> set.seed(123) # initialize the random number generator
> clusters <- Clusterize(seqs, cutoff=0.1, processors=1)
Partitioning sequences by 6-mer similarity:
```

```
iteration 8 of up to 400 (100.0% coverage)
```

```
Time difference of 0.1 secs
```

```
Sorting by relatedness within 1 group:
```

```
iteration 51 of up to 51 (100.0% stability)
```

```
Time difference of 2.17 secs
```

```
Clustering sequences by 4-mer similarity:
```

```
=====
```

```
Clusters via relatedness sorting: 100% (0% exclusively)
```

```
Clusters via rare 4-mers: 100% (0% exclusively)
```

```
Estimated clustering effectiveness: 100%
```

```
Time difference of 0.28 secs
```

```
> set.seed(NULL) # reset the seed
```

Now you know how to utilize `Clusterize` to cluster sequences.

7 Session Information

All of the output in this vignette was produced under the following conditions:

- R version 4.3.0 RC (2023-04-13 r84257), x86_64-apple-darwin20
