

# Package ‘SIAMCAT’

October 16, 2018

**Type** Package

**Title** Statistical Inference of Associations between Microbial Communities And host phenoTypes

**Version** 1.0.0

**Description** Pipeline for Statistical Inference of Associations between Microbial Communities And host phenoTypes (SIAMCAT). A primary goal of analyzing microbiome data is to determine changes in community composition that are associated with environmental factors. In particular, linking human microbiome composition to host phenotypes such as diseases has become an area of intense research. For this, robust statistical modeling and biomarker extraction toolkits are crucially needed. SIAMCAT provides a full pipeline supporting data preprocessing, statistical association testing, statistical modeling (LASSO logistic regression) including tools for evaluation and interpretation of these models (such as cross validation, parameter selection, ROC analysis and diagnostic model plots).

**Depends** R (>= 3.5.0), mlr, phyloseq

**Imports** beanplot, glmnet, graphics, grDevices, grid, gridBase, gridExtra, LiblinearR, matrixStats, methods, ParamHelpers, pROC, PRROC, RColorBrewer, stats, utils

**License** GPL-3

**LazyData** true

**RoxygenNote** 6.0.1.9000

**biocViews** Metagenomics, Classification, Microbiome, Sequencing, Preprocessing, Clustering, FeatureExtraction, GeneticVariability, MultipleComparison, Regression

**Suggests** BiocStyle, optparse, testthat, knitr, rmarkdown

**VignetteBuilder** knitr

**git\_url** <https://git.bioconductor.org/packages/SIAMCAT>

**git\_branch** RELEASE\_3\_7

**git\_last\_commit** b5e27eb

**git\_last\_commit\_date** 2018-04-30

**Date/Publication** 2018-10-15

**Author** Georg Zeller [aut] (<<https://orcid.org/0000-0003-1429-7485>>),

---

|            |  |
|------------|--|
| accessSlot | <i>Universal slot accessor function for siamcat-class.</i> |
|------------|--|

---

**Description**

This function is used internally by many accessors.

**Usage**

```
accessSlot(siamcat, slot)
```

**Arguments**

|         |   |
|---------|---|
| siamcat | an object of <a href="#">siamcat-class</a> .  |
| slot    | A character string indicating the slot (not data class) of the component data type that is desired. |

**Value**

Returns the component object specified by the argument slot. Returns NULL if slot does not exist.

**Examples**

```
#
data(siamcat_example)
accessSlot(siamcat_example, "label")
accessSlot(siamcat_example, "model_list")
```

---

|               |                                   |
|---------------|-----------------------------------|
| add.meta.pred | <i>Add metadata as predictors</i> |
|---------------|-----------------------------------|

---

**Description**

This function adds metadata to the feature matrix to be later used as predictors

**Usage**

```
add.meta.pred(siamcat, pred.names = NULL, std.meta =
  TRUE, verbose = 1)
```

**Arguments**

|            |  |
|------------|--|
| siamcat    | object of class <a href="#">siamcat-class</a>  |
| pred.names | vector of names of the variables within the metadata to be added to the feature matrix as predictors   |
| std.meta   | boolean, should added metadata features be standardized?, defaults to TRUE   |
| verbose    | control output: 0 for no output at all, 1 for only information about progress and success, 2 for normal level of information and 3 for full debug information, defaults to 1 |

**Value**

an object of class `siamcat-class` with metadata added to the features

**Examples**

```
data(siamcat_example)
# Add the Age of the patients as potential predictor
siamcat_age_added <- add.meta.pred(siamcat_example, pred.names=c('age'))

# Add Age, BMI, and Gender as potential predictors
# Additionally, prevent standardization of the added features
siamcat_meta_added <- add.meta.pred(siamcat_example, pred.names=c('age',
'bmi', 'gender'), std.meta=FALSE)
```

---

check.associations      *Check and visualize associations between features and classes*

---

**Description**

This function calculates for each feature a pseudo-fold change (geometrical mean of the difference between quantiles) between the different classes found in labels.

Significance of the differences is computed for each feature using a Wilcoxon test followed by multiple hypothesis testing correction.

Additionally, the Area Under the Receiver Operating Characteristic Curve (AU-ROC) and a prevalence shift are computed for the features found to be associated with the two different classes at a user-specified significance level  $\alpha$ .

Finally, the function produces a plot of the top `max.show` associated features, showing the distribution of the  $\log_{10}$ -transformed abundances for both classes, and user-selected panels for the effect (AU-ROC, Prevalence Shift, and Fold Change)

**Usage**

```
check.associations(siamcat,fn.plot,color.scheme = "RdYlBu",
  alpha = 0.05,mult.corr = "fdr", sort.by = "fc",detect.lim = 1e-06,
  pr.cutoff = 1e-6, max.show = 50, plot.type = "quantile.box",
  panels = c("fc","auroc"),verbose = 1)
```

**Arguments**

|                           |  |
|---------------------------|--|
| <code>siamcat</code>      | object of class <code>siamcat-class</code>   |
| <code>fn.plot</code>      | filename for the pdf-plot  |
| <code>color.scheme</code> | valid R color scheme or vector of valid R colors (must be of the same length as the number of classes), defaults to 'RdYlBu' |
| <code>alpha</code>        | float, significance level, defaults to 0.05  |
| <code>mult.corr</code>    | multiple hypothesis correction method, see <a href="#">p.adjust</a> , defaults to "fdr"                                      |
| <code>sort.by</code>      | string, sort features by p-value ("p.val"), by fold change ("fc") or by prevalence shift ("pr.shift"), defaults to "fc"      |
| <code>detect.lim</code>   | float, pseudocount to be added before log-transformation of the data, defaults to 1e-06                                      |

|           |  |
|-----------|--|
| pr.cutoff | float, cutoff for the prevalence computation, defaults to 1e-06  |
| max.show  | integer, how many associated features should be shown, defaults to 50  |
| plot.type | string, specify how the abundance should be plotted, must be one of these: c("bean", "box", "quantile.box", "quantile.rect"), defaults to "quantile.box"                     |
| panels    | vector, name of the panels to be plotted next to the log10- transformed abundances, possible entries are c("fc", "auroc", "prevalence"), defaults to c("fc", "auroc")        |
| verbose   | control output: 0 for no output at all, 1 for only information about progress and success, 2 for normal level of information and 3 for full debug information, defaults to 1 |

### Value

Does not return anything, but produces an association plot

### Examples

```
# Example data
data(siamcat_example)
# since the whole pipeline has been run in the example data, exchange the
# normalized features with the original features
siamcat_example <- reset.features(siamcat_example)

# Simple example
check.associations(siamcat_example, './assoc_plot.pdf')

# Plot associations as bean plot
check.associations(siamcat_example, './assoc_plot_bean.pdf',
plot.type='bean')

# Plot associations as box plot
# Additionally, sort by p-value instead of by fold change
check.associations(siamcat_example, './assoc_plot_fc.pdf',
plot.type='box', sort.by='p.val')

# Custom colors
check.associations(siamcat_example, './assoc_plot_blue_yellow.pdf',
plot.type='box', color.scheme=c('cornflowerblue', '#ffc125'))
```

---

check.confounders      *Check for potential confounders in the metadata*

---

### Description

This function checks for associations between class labels and potential confounders (e.g. age, sex, or BMI) that are present in the metadata. Statistical testing is performed with Fisher's exact test or Wilcoxon test, while associations are visualized either as barplot or Q-Q plot, depending on the type of metadata.

### Usage

```
check.confounders(siamcat, fn.plot, verbose = 1)
```

**Arguments**

|         |  |
|---------|--|
| siamcat | an object of class <a href="#">siamcat-class</a>   |
| fn.plot | string, filename for the pdf-plot  |
| verbose | control output: 0 for no output at all, 1 for only information about progress and success, 2 for normal level of information and 3 for full debug information, defaults to 1 |

**Value**

Does not return anything, but produces a single plot for each metadata category.

**Examples**

```
# Example data
data(siamcat_example)
# since the whole pipeline has been run in the example data, exchange the
# normalized features with the original features
siamcat_example <- reset.features(siamcat_example)

# Simple working example
check.confounders(siamcat_example, './conf_plot.pdf')

# Additional information with verbose
## Not run:
check.confounders(siamcat_example, './conf_plot.pdf',
  verbose=2)
## End(Not run)
```

---

create.data.split      *Split a dataset into training and a test sets.*

---

**Description**

This function prepares the cross-validation by splitting the data into num.folds training and test folds for num.resample times.

**Usage**

```
create.data.split(siamcat, num.folds = 2, num.resample = 1,
  stratify = TRUE, inseparable = NULL, verbose = 1)
```

**Arguments**

|              |  |
|--------------|--|
| siamcat      | object of class <a href="#">siamcat-class</a>  |
| num.folds    | number of cross-validation folds (needs to be >=2), defaults to 2  |
| num.resample | resampling rounds (values <= 1 deactivate resampling), defaults to 1   |
| stratify     | boolean, should the splits be stratified so that an equal proportion of classes are present in each fold?, defaults to TRUE  |
| inseparable  | column name of metadata variable, defaults to NULL   |
| verbose      | control output: 0 for no output at all, 1 for only information about progress and success, 2 for normal level of information and 3 for full debug information, defaults to 1 |

## Details

This function splits the labels within a [siamcat-class](#) object and prepares the internal cross-validation for the model training (see [train.model](#)).

The function saves the training and test instances for the different cross-validation folds within a list in the `data_split`-slot of the [siamcat-class](#) object, which is a list with four entries:

- `num.folds` the number of cross-validation folds
- `num.resample` the number of repetitions for the cross-validation
- `training.folds` a list containing the indices for the training instances
- `test.folds` a list containing the indices for the test instances

## Value

object of class [siamcat-class](#) with the `data_split`-slot filled

## Examples

```
data(siamcat_example)
# simple working example
siamcat_split <- create.data.split(siamcat_example, num.folds=10,
num.resample=5, stratify=TRUE)

## # example with a variable which is to be inseparable
## siamcat_split <- create.data.split(siamcat_example, num.folds=10,
## num.resample=5, stratify=FALSE, inseparable='Gender')
```

---

`data_split`

*Retrieve a [data\\_split-class](#) object from object.*

---

## Description

Retrieve a [data\\_split-class](#) object from object.

## Usage

```
data_split(siamcat)

## S4 method for signature 'ANY'
data_split(siamcat)

## S4 method for signature 'data_split'
data_split(siamcat)

## S4 method for signature 'list'
data_split(siamcat)
```

## Arguments

`siamcat` (Required). An instance of [siamcat-class](#) that contains a label or instance of [data\\_split-class](#) or a list.

**Value**

The `data_split-class` object or NULL.

**Examples**

```
data(siamcat_example)
data_split(siamcat_example)
```

---

|                  |   |
|------------------|---|
| data_split-class | <i>The S4 class for storing data splits</i> |
|------------------|---|

---

**Description**

The S4 class for storing data splits

**Slots**

.Data inherited from `list` class, contains a list with:

- `training.folds` a list - for each cv fold contains ids of samples used for training
- `test.folds` a list - for each cv fold contains ids of samples used for testing
- `num.resample` number of repetition rounds for cv
- `num.folds` number of folds for cv

---

|              |  |
|--------------|--|
| data_split<- | <i>Assign a new data_split object to x</i> |
|--------------|--|

---

**Description**

Assign a new `data_split` object to x

**Usage**

```
data_split(x) <- value

## S4 replacement method for signature 'siamcat,data_split'
data_split(x) <- value
```

**Arguments**

|       |  |
|-------|--|
| x     | an object of class <code>siamcat-class</code>    |
| value | an object of class <code>data_split-class</code> |

**Value**

none

**Examples**

```
data(siamcat_example)
data_split(siamcat_example) <- data_split(siamcat_example)
```

---

evaluate.predictions *Evaluate prediction results*

---

## Description

This function takes the correct labels and predictions for all samples and evaluates the results using the

- Area Under the Receiver Operating Characteristic (ROC) Curve (AU-ROC)
- and the Precision-Recall Curve (PR)

as metric. Predictions can be supplied either for a single case or as matrix after resampling of the dataset.

Prediction results are usually produced with the function [make.predictions](#).

## Usage

```
evaluate.predictions(siamcat, verbose = 1)
```

## Arguments

|         |  |
|---------|--|
| siamcat | object of class <a href="#">siamcat-class</a>  |
| verbose | control output: 0 for no output at all, 1 for only information about progress and success, 2 for normal level of information and 3 for full debug information, defaults to 1 |

## Details

This functions calculates for the predictions in the `pred_matrix` -slot of the [siamcat-class](#)-object several metrics. The Area Under the Receiver Operating Characteristic (ROC) Curve (AU-ROC) and the Precision-Recall Curve will be evaluated and the results will be saved in the `eval_data`-slot of the supplied [siamcat-class](#)-object. The `eval_data`-slot contains a list with several entries:

- `$roc`. average average ROC-curve across repeats or a single ROC-curve on complete dataset;
- `$auc`. average AUC value for the average ROC-curve;
- `$ev.list` list of length(`num.folds`), containing for different decision thresholds the number of false positives, false negatives, true negatives, and true positives;
- `$pr.list` list of length(`num.folds`), containing the positive predictive value (precision) and true positive rate (recall) values used to plot the PR curves.

For the case of repeated cross-validation, the function will additionally return

- `$roc.all` list of roc objects (see [roc](#)) for every repeat;
- `$aucspr` vector of AUC values for the PR curves for every repeat;
- `$auc.all` vector of AUC values for the ROC curves for every repeat.

## Value

object of class [siamcat-class](#) with the slot `eval_data` filled

**Examples**

```
data(siamcat_example)
# simple working example
siamcat_evaluated <- evaluate.predictions(siamcat_example)
```

---

|           |  |
|-----------|--|
| eval_data | <i>Retrieve eval_data from object.</i> |
|-----------|--|

---

**Description**

Retrieve eval\_data from object.

**Usage**

```
eval_data(siamcat)

## S4 method for signature 'ANY'
eval_data(siamcat)

## S4 method for signature 'list'
eval_data(siamcat)
```

**Arguments**

siamcat (Required). An instance of [siamcat-class](#) that contains a eval\_data..

**Value**

The eval\_data list or NULL.

**Examples**

```
data(siamcat_example)
eval_data(siamcat_example)
```

---

|                 |  |
|-----------------|--|
| eval_data-class | <i>The S4 class for storing evaluation data.</i> |
|-----------------|--|

---

**Description**

The S4 class for storing evaluation data.

**Slots**

.Data inherited from `list` class, contains a list with:

- `$roc.average` average ROC-curve across repeats or a single ROC-curve on complete dataset;
- `$auc.average` AUC value for the average ROC-curve;
- `$ev.list` list of length(`num.folds`), containing for different decision thresholds the number of false positives, false negatives, true negatives, and true positives;
- `$pr.list` list of length(`num.folds`), containing the positive predictive value (precision) and true positive rate (recall) values used to plot the PR curves;

. If prediction had more than one column, i.e. if the models has been trained with several repeats, the function will additionally return

- `$roc.all` list of roc objects (see `roc`) for every repeat;
- `$aucspr` vector of AUC values for the PR curves for every repeat;
- `$auc.all` vector of AUC values for the ROC curves for every repeat

---

```
eval_data<-          Assign a new eval_data object to x
```

---

**Description**

Assign a new `eval_data` object to `x`

**Usage**

```
eval_data(x) <- value

## S4 replacement method for signature 'siamcat,list'
eval_data(x) <- value
```

**Arguments**

`x`                    an object of class `siamcat-class`  
`value`                an `eval_data` list

**Value**

none

**Examples**

```
data(siamcat_example)
eval_data(siamcat_example) <- eval_data(siamcat_example)
```

---

|          |   |
|----------|---|
| features | <i>Retrieve a <a href="#">otu_table-class</a> object from object.</i> |
|----------|---|

---

**Description**

Retrieve a [otu\\_table-class](#) object from object.

**Usage**

```
features(siamcat)

## S4 method for signature 'ANY'
features(siamcat)

## S4 method for signature 'otu_table'
features(siamcat)
```

**Arguments**

siamcat (Required). An instance of [siamcat-class](#) that contains a label or instance of [otu\\_table-class](#).

**Value**

The [otu\\_table-class](#) object or NULL.

**Examples**

```
data(siamcat_example)
features(siamcat_example)
```

---

|            |   |
|------------|---|
| features<- | <i>Assign a new <a href="#">otu_table</a> object to x features slot</i> |
|------------|---|

---

**Description**

Assign a new [otu\\_table](#) object to x features slot

**Usage**

```
features(x) <- value

## S4 replacement method for signature 'siamcat,otu_table'
features(x) <- value
```

**Arguments**

x an object of class [siamcat-class](#)  
value an object of class [otu\\_table-class](#)

**Value**

none

**Examples**

```
data(siamcat_example)
features(siamcat_example) <- features(siamcat_example)
```

---

|                 |  |
|-----------------|--|
| filter.features | <i>Perform unsupervised feature filtering.</i> |
|-----------------|--|

---

**Description**

This function performs unsupervised feature filtering. Features can be filtered based on abundance or prevalence. Additionally, unmapped reads may be removed.

**Usage**

```
filter.features(siamcat, filter.method = "abundance",
               cutoff = 0.001, recomb.prop = FALSE, rm.unmapped = TRUE, verbose = 1)
```

**Arguments**

|               |  |
|---------------|--|
| siamcat       | an object of class <a href="#">siamcat-class</a>   |
| filter.method | method used for filtering the features, can be one of these: c('abundance', 'cum.abundance', 'prevalence'), defaults to 'abundance'  |
| cutoff        | float, abundance or prevalence cutoff, default to 0.001  |
| recomb.prop   | boolean, should relative abundances be recomputed?, defaults to FALSE  |
| rm.unmapped   | boolean, should unmapped reads be discarded?, defaults to TRUE   |
| verbose       | control output: 0 for no output at all, 1 for only information about progress and success, 2 for normal level of information and 3 for full debug information, defaults to 1 |

**Details**

This function filters the features in a [siamcat-class](#) object in a unsupervised manner.

The different filter methods work in the following way:

- 'abundance' remove features whose abundance is never above the threshold value in any of the samples
- 'cum.abundance' remove features with very low abundance in all samples i.e. ones that are never among the most abundant entities that collectively make up (1-cutoff) of the reads in any sample
- 'prevalence' remove features with low prevalence across samples i.e. ones that are 0 (undetected) in more than (1-cutoff) proportion of samples.

**Value**

siamcat an object of class [siamcat-class](#)

## Examples

```
# Example dataset
data(siamcat_example)
# since the whole pipeline has been run in the example data, the feature
# were filtered already.
siamcat_example <- reset.features(siamcat_example)

# Simple examples
siamcat_filtered <- filter.features(siamcat_example,
  filter.method='abundance',
  cutoff=1e-03)
```

---

|              |  |
|--------------|--|
| filter.label | <i>Filter samples from siamcat@label</i> |
|--------------|--|

---

## Description

This functions filters siamcat@label.

## Usage

```
filter.label(siamcat, ids, verbose = 1)
```

## Arguments

|         |  |
|---------|--|
| siamcat | an object of class <a href="#">siamcat-class</a>   |
| ids     | names of samples to be left in the siamcat@label   |
| verbose | control output: 0 for no output at all, 1 for more information about progress and success, defaults to 1 |

## Value

siamcat an object of class [siamcat-class](#)

## Examples

```
data(siamcat_example)
# simple working example
siamcat_filtered <- filter.label(siamcat_example, ids=c(1:10))
```

---

`get.features.matrix`    *get.features.matrix*

---

**Description**

Function to access features in `siamcat@phylose@otu_table`

**Usage**

```
get.features.matrix(siamcat)
```

**Arguments**

`siamcat`            an object of class `siamcat-classt`

**Details**

Access features in `siamcat@phylose@otu_table` as matrix

**Value**

Features as a matrix

**Examples**

```
data(siamcat_example)
feat <- get.features.matrix(siamcat_example)
```

---

`get.orig_feat.matrix`    *get.orig\_feat.matrix*

---

**Description**

Function to access original features in `siamcat@orig_feat`

**Usage**

```
get.orig_feat.matrix(siamcat)
```

**Arguments**

`siamcat`            an object of class `siamcat-classt`

**Details**

Access original features in `siamcat@orig_feat` as matrix

**Value**

Original features as a matrix

**Examples**

```
data(siamcat_example)
orig_feat <- get.orig_feat.matrix(siamcat_example)
```

---

|       |   |
|-------|---|
| label | Retrieve a <i>label-class</i> object from object. |
|-------|---|

---

**Description**

Retrieve a [label-class](#) object from object.

**Usage**

```
label(siamcat)

## S4 method for signature 'ANY'
label(siamcat)

## S4 method for signature 'label'
label(siamcat)

## S4 method for signature 'list'
label(siamcat)

## S4 method for signature 'otu_table'
orig_feat(siamcat)
```

**Arguments**

siamcat (Required). An instance of [siamcat-class](#) that contains a label or instance of [label-class](#) or a list.

**Value**

The [label-class](#) object or NULL.

**Examples**

```
data(siamcat_example)
label(siamcat_example)
```

---

|             |   |
|-------------|---|
| label-class | <i>The S4 class for storing label info.</i> |
|-------------|---|

---

### Description

The S4 class for storing label info.

### Slots

.Data inherited from `list` class, contains a list with:

- `label` numeric vector, specifying to which category samples belong, usually made of 1s and -1s
- `header` contains information from the header of the label file
- `info` list with additional informations about the dataset
- `positive.lab` specifies which of two numbers in label is a positive label
- `negative.lab` specifies which of two numbers in label is a negative label
- `n.idx` numeric vector - on which positions in the label there are samples with negative label
- `p.idx` numeric vector - on which positions in the label there are samples with positive label
- `n.lab` character string with a name for the negative label (e.g. 'healthy')
- `p.lab` character string with a name for the positive label (e.g. 'cancer')

---

|         |                                       |
|---------|---------------------------------------|
| label<- | <i>Assign a new label object to x</i> |
|---------|---------------------------------------|

---

### Description

Assign a new label object to x

### Usage

```
label(x) <- value
```

```
## S4 replacement method for signature 'siamcat,label'
label(x) <- value
```

### Arguments

|       |   |
|-------|---|
| x     | an object of class <code>siamcat-class</code> |
| value | an object of class <code>label-class</code>   |

### Value

none

### Examples

```
data(siamcat_example)
label(siamcat_example) <- label(siamcat_example)
```

---

|                  |                                       |
|------------------|---------------------------------------|
| make.predictions | <i>Make predictions on a test set</i> |
|------------------|---------------------------------------|

---

## Description

This function takes a [siamcat-class](#)-object containing a model trained by [train.model](#) and performs predictions on a given test-set.

## Usage

```
make.predictions(siamcat, siamcat.holdout = NULL,  
                normalize.holdout = TRUE, verbose = 1)
```

## Arguments

|                   |   |
|-------------------|---|
| siamcat           | object of class <a href="#">siamcat-class</a>   |
| siamcat.holdout   | optional, object of class <a href="#">siamcat-class</a> on which to make predictions, defaults to NULL  |
| normalize.holdout | boolean, should the holdout features be normalized with a frozen normalization (see <a href="#">normalize.features</a> ) using the normalization parameters in siamcat?, defaults to TRUE |
| verbose           | control output: 0 for no output at all, 1 for only information about progress and success, 2 for normal level of information and 3 for full debug information, defaults to 1              |

## Details

This functions uses the model in the `model_list`-slot of the `siamcat` object to make predictions on a given test set. The test set can either consist of the test instances in the cross-validation, saved in the `data_split`-slot of the same `siamcat` object, or a completely external feature set, given in the form of another `siamcat` object (`siamcat.holdout`).

## Value

object of class [siamcat-class](#) with the slot `pred_matrix` filled or a matrix containing the predictions for the holdout set

## Examples

```
data(siamcat_example)  
# Simple example  
siamcat.pred <- make.predictions(siamcat_example)  
  
# Predictions on a holdout-set  
## Not run: pred.mat <- make.predictions(siamcat.trained, siamcat.holdout,  
    normalize.holdout=TRUE)  
## End(Not run)
```

---

|      |   |
|------|---|
| meta | <i>Retrieve a <a href="#">sample_data-class</a> object from object.</i> |
|------|---|

---

**Description**

Retrieve a [sample\\_data-class](#) object from object.

**Usage**

```
meta(siamcat)

## S4 method for signature 'ANY'
meta(siamcat)

## S4 method for signature 'sample_data'
meta(siamcat)
```

**Arguments**

siamcat (Required). An instance of [siamcat-class](#) that contains a label or instance of [sample\\_data-class](#).

**Value**

The [sample\\_data-class](#) object or NULL.

**Examples**

```
data(siamcat_example)
meta(siamcat_example)
```

---

|        |  |
|--------|--|
| meta<- | <i>Assign a new sam_data object to x</i> |

**Description**

Assign a new sam\_data object to x

**Usage**

```
meta(x) <- value

## S4 replacement method for signature 'siamcat,sample_data'
meta(x) <- value
```

**Arguments**

x an object of class [siamcat-class](#)  
 value an object of class [sample\\_data-class](#)

**Value**

none

**Examples**

```
data(siamcat_example)
meta(siamcat_example) <- meta(siamcat_example)
```

---

model.evaluation.plot *Model Evaluation Plot*

---

**Description**

Produces two plots for model evaluation. The first plot shows the Receiver Operating Characteristic (ROC)-curves, the other the Precision-recall (PR)-curves for the different cross-validation repetitions.

**Usage**

```
model.evaluation.plot(siamcat, fn.plot, verbose = 1)
```

**Arguments**

|         |  |
|---------|--|
| siamcat | object of class <a href="#">siamcat-class</a>  |
| fn.plot | string, filename for the pdf-plot  |
| verbose | control output: 0 for no output at all, 1 for only information about progress and success, 2 for normal level of information and 3 for full debug information, defaults to 1 |

**Value**

Does not return anything, but produces the model evaluation plot.

**Examples**

```
data(siamcat_example)
# simple working example
model.evaluation.plot(siamcat_example, fn.plot='./eval.pdf')
```

---

```
model.interpretation.plot
```

*Model Interpretation Plot*

---

### Description

Produces a plot for model interpretation, displaying feature weights, robustness of feature weights, and features scores across patients.

### Usage

```
model.interpretation.plot(siamcat, fn.plot, color.scheme = "BrBG",
  consens.thres = 0.5, heatmap.type = c("zscore", "fc"),
  norm.models = FALSE, limits = c(-3, 3), detect.lim = 1e-06,
  max.show = 50, verbose = 1)
```

### Arguments

|               |  |
|---------------|--|
| siamcat       | object of class <a href="#">siamcat-class</a>  |
| fn.plot       | string, filename for the pdf-plot  |
| color.scheme  | color scheme for the heatmap, defaults to 'BrBG'   |
| consens.thres | minimal ratio of models incorporating a feature in order to include it into the heatmap, defaults to 0.5 Note that for 'randomForest' models, this cutoff specifies the minimum median Gini coefficient for a feature to be included and should therefore be much lower, e.g. 0.01 |
| heatmap.type  | type of the heatmap, can be either 'fc' or 'zscore', defaults to 'zscore'  |
| norm.models   | boolean, should the feature weights be normalized across models?, defaults to FALSE  |
| limits        | vector, cutoff for extreme values in the heatmap, defaults to c(-3, 3)   |
| detect.lim    | float, pseudocount to be added before log-transformation of features, defaults to 1e-06  |
| max.show      | integer, maximum number of features to be shown in the model interpretation plot, defaults to 50   |
| verbose       | control output: 0 for no output at all, 1 for only information about progress and success, 2 for normal level of information and 3 for full debug information, defaults to 1   |

### Details

Produces a plot consisting of

- a barplot showing the feature weights and their robustness (i.e. in what proportion of models have they been incorporated)
- a heatmap showing the z-scores of the metagenomic features across patients
- another heatmap displaying the metadata categories (if applicable)
- a boxplot displaying the poportion of weight per model that is actually shown for the features that are incorporated into more than consens.thres percent of the models.

**Value**

Does not return anything, but produces the model interpretation plot.

**Examples**

```
data(siamcat_example)
# simple working example
model.interpretation.plot(siamcat_example, fn.plot='./interpretation.pdf',
heatmap.type='zscore')
```

---

models

*Retrieve list of models from object.*

---

**Description**

Retrieve list of models from object.

**Usage**

```
models(siamcat)

## S4 method for signature 'ANY'
models(siamcat)
```

**Arguments**

siamcat (Required). An instance of [siamcat-class](#) that contains a [model\\_list](#) or instance of [model\\_list-class](#).

**Value**

The list of models or NULL.

**Examples**

```
data(siamcat_example)
models(siamcat_example)
```

---

|            |   |
|------------|---|
| model_list | Retrieve <i>model_list-class</i> from object. |
|------------|---|

---

### Description

Retrieve [model\\_list-class](#) from object.

### Usage

```
model_list(siamcat)

## S4 method for signature 'ANY'
model_list(siamcat)

## S4 method for signature 'model_list'
model_list(siamcat)

## S4 method for signature 'model_list'
models(siamcat)

## S4 method for signature 'model_list'
model_type(siamcat)
```

### Arguments

siamcat (Required). An instance of [siamcat-class](#) that contains a `model_list` or instance of [model\\_list-class](#).

### Value

The [model\\_list-class](#) object or NULL.

### Examples

```
data(siamcat_example)
model_list(siamcat_example)
```

---

|                  |                                  |

model_list(x) <- value

## S4 replacement method for signature 'siamcat,model_list'
model_list(x) <- value
```

**Arguments**

|       |   |
|-------|---|
| x     | an object of class <a href="#">siamcat-class</a>    |
| value | an object of class <a href="#">model_list-class</a> |

**Value**

none

**Examples**

```
data(siamcat_example)
model_list(siamcat_example) <- model_list(siamcat_example)
```

---

|            |   |
|------------|---|
| model_type | <i>Retrieve model_type from object.</i> |
|------------|---|

---

**Description**

Retrieve model\_type from object.

**Usage**

```
model_type(siamcat)

## S4 method for signature 'ANY'
model_type(siamcat)
```

**Arguments**

|         |   |
|---------|---|
| siamcat | (Required). An instance of <a href="#">siamcat-class</a> that contains a model_list or instance of <a href="#">model_list-class</a> . |
|---------|---|

**Value**

The string describing type of model used or NULL.

**Examples**

```
data(siamcat_example)
model_type(siamcat_example)
```

---

|                    |                                      |
|--------------------|--------------------------------------|
| normalize.features | <i>Perform feature normalization</i> |
|--------------------|--------------------------------------|

---

**Description**

This function performs feature normalization according to user- specified parameters.

**Usage**

```
normalize.features(siamcat,
norm.method = c("rank.unit", "rank.std", "log.std", "log.unit", "log.clr"),
norm.param = list(log.n0 = 1e-06, sd.min.q = 0.1, n.p = 2, norm.margin = 1),
verbose = 1)
```

**Arguments**

|             |  |
|-------------|--|
| siamcat     | an object of class <a href="#">siamcat-class</a>   |
| norm.method | string, normalization method, can be one of these: 'c('rank.unit', 'rank.std', 'log.std', 'log.clr', 'log.unit')   |
| norm.param  | list, specifying the parameters of the different normalization methods, see details for more information   |
| verbose     | control output: 0 for no output at all, 1 for only information about progress and success, 2 for normal level of information and 3 for full debug information, defaults to 1 |

**Details**

There are five different normalization methods available:

- 'rank.unit' converts features to ranks and normalizes each column (=sample) by the square root of the sum of ranks
- 'rank.std' converts features to ranks and applies z-score standardization
- 'log.clr' centered log-ratio transformation (with the addition of pseudocounts)
- 'log.std' log-transforms features (after addition of pseudocounts) and applies z-score standardization
- 'log.unit' log-transforms features (after addition of pseudocounts) and normalizes by features or samples with different norms

The list entries in 'norm.param' specify the normalization parameters, which are dependant on the normalization method of choice:

- 'rank.unit' does not require any other parameters
- 'rank.std' requires sd.min.q, quantile of the distribution of standard deviations of all features that will be added to the denominator during standardization in order to avoid underestimation of the standard deviation, defaults to 0.1
- 'clr' requires log.n0, which is the pseudocount to be added before log-transformation, defaults to NULL leading to the estimation of log.n0 from the data

- 'log.std' requires both log.n0 and sd.min.q, using the same default values
- 'log.unit' requires next to log.n0 also the parameters n.p and norm.margin. n.p specifies the vector norm to be used, can be either 1 for  $x/\text{sum}(x)$  or 2 for  $x/\sqrt{\text{sum}(x^2)}$ . The parameter norm.margin specifies the margin over which to normalize, similarly to the apply-syntax: Allowed values are 1 for normalization over features, 2 over samples, and 3 for normalization by the global maximum.

The function additionally allows to perform a frozen normalization on a different dataset. After normalizing the first dataset, the output list \$par contains all parameters of the normalization. Supplying this list together with a new dataset will normalize the second dataset in a comparable way to the first dataset (e.g. by using the same mean for the features for z-score standardization)

## Value

an object of class [siamcat-class](#) with normalized features

## Examples

```
# Example data
data(siamcat_example)
# since the whole pipeline has been run in the example data, exchange the
# normalized features with the original features
siamcat_example <- reset.features(siamcat_example)

# Simple example
siamcat_norm <- normalize.features(siamcat_example,
norm.method='rank.unit')

# log.unit example
siamcat_norm <- normalize.features(siamcat_example,
norm.method='log.unit', norm.param=list(log.n0=1e-05, n.p=1,
norm.margin=1))

# log.std example
siamcat_norm <- normalize.features(siamcat_example,
norm.method='log.std', norm.param=list(log.n0=1e-05, sd.min.q=.1))
```

---

norm\_param

*Retrieve norm\_param from object.*

---

## Description

Retrieve norm\_param from object.

## Usage

```
norm_param(siamcat)
```

```
## S4 method for signature 'ANY'
norm_param(siamcat)
```

**Arguments**

siamcat (Required). An instance of [siamcat-class](#) that contains a norm\_param

**Value**

The norm\_param list or NULL.

**Examples**

```
data(siamcat_example)
norm_param(siamcat_example)
```

---

norm\_param<- *Assign a new norm\_param object to x*

---

**Description**

Assign a new norm\_param object to x

**Usage**

```
norm_param(x) <- value

## S4 replacement method for signature 'siamcat,list'
norm_param(x) <- value
```

**Arguments**

x an object of class [siamcat-class](#)  
value an norm\_param list

**Value**

none

**Examples**

```
data(siamcat_example)
norm_param(siamcat_example) <- norm_param(siamcat_example)
```

---

**Value**

none

**Examples**

```
data(siamcat_example)
pred_matrix(siamcat_example) <- pred_matrix(siamcat_example)
```

---

```
read.features          Read feature file
```

---

**Description**

This file reads in the tsv file with features and converts it into a matrix.

The file should be organized as follows: features (in rows) x samples (in columns).

First row should contain sample labels (consistent with label data), while the first column should contain feature labels (e.g. taxonomic identifiers). The remaining entries are expected to be real values  $\geq 0$  that quantify the abundance of each feature in each sample.

**Usage**

```
read.features(fn.in.feats, verbose = 0)
```

**Arguments**

fn.in.feats        name of the tsv file containing features  
verbose            control output: 0 for no output at all, 1 for information about progress and time,  
                  defaults to 0

**Value**

otu\_table containing features from the file

**Examples**

```
# run with example data
fn.feats <- system.file('extdata',
  'feat_crc_study-pop-I_N141_tax_profile_mocat_bn_specI_clusters.tsv',
  package = 'SIAMCAT')

features <- read.features(fn.feats)
```

---

read.labels

*Read labels file*

---

**Description**

This file reads in the tsv file with labels and converts it into a label object.

First row is expected to be #BINARY:1=[label for cases]; -1=[label for controls].  
Second row should contain the sample identifiers as tab-separated list (consistent with feature and metadata).

Third row is expected to contain the actual class labels (tab-separated): 1 for each case and -1 for each control.

Note: Labels can take other numeric values (but not characters or strings); importantly, the label for cases has to be greater than the one for controls

**Usage**

```
read.labels(fn.in.label)
```

**Arguments**

fn.in.label      name of the tsv file containing labels

**Value**

label object containing several entries:

- \$label named vector containing the numerical labels from the file;
- \$header first row of the label file;
- \$info information about the type of label (e.g. BINARY);
- \$positive.lab numerical label for controls, e.g. -1;
- \$negative.lab numerical label for cases, e.g. 1;
- \$n.idx logical vector of labels (TRUE for controls, FALSE otherwise);
- \$n.lab label for controls, e.g. healthy;
- \$p.idx logical vector of labels (TRUE for cases, FALSE otherwise);
- \$p.lab label for cases, e.g. cancer

## Examples

```
# run with example data
fn.label <- system.file('extdata',
  'label_crc_study-pop-I_N141_tax_profile_mocat_bn_specI_clusters.tsv',
  package = 'SIAMCAT')

labels <- read.labels(fn.label)
```

---

|           |                           |
|-----------|---------------------------|
| read.meta | <i>Read metadata file</i> |
|-----------|---------------------------|

---

## Description

This file reads in the tsv file with numerical metadata and converts it into a matrix.

The file should be organized as follows: samples (in rows) x metadata (in columns). Metadata needs to be converted to numerical values by the user.

Metadata may be optional for the SIAMCAT workflow, but are necessary for heatmap displays, see [model.interpretation.plot](#)

## Usage

```
read.meta(fn.in.meta)
```

## Arguments

fn.in.meta      name of the tsv file containing metadata

## Value

sample\_data object

## Examples

```
# run with example data
fn.meta <- system.file('extdata',
  'num_metadata_crc_study-pop-I_N141_tax_profile_mocat_bn_specI_clusters.tsv',
  package = 'SIAMCAT')

meta_data <- read.meta(fn.meta)
```

---

|                |                       |
|----------------|-----------------------|
| reset.features | <i>reset.features</i> |
|----------------|-----------------------|

---

### Description

Function reset features in `siamcat@phylose@otu_table` to those in `siamcat@orig_feat` in an object of class [siamcat-class](#)

### Usage

```
reset.features(siamcat)
```

### Arguments

`siamcat` an object of class [siamcat-class](#)

### Details

Reset features in `siamcat@phylose@otu_table` to those in `siamcat@orig_feat`

### Value

A new [siamcat-class](#) object

### Examples

```
data(siamcat_example)
siamcat_example <- reset.features(siamcat_example)
```

---

|                |   |
|----------------|---|
| select.samples | <i>Select samples based on metadata</i> |
|----------------|---|

---

### Description

This functions selects labels and metadata based on a specific column in the metadata. Provided with a column-name in the metadata and a range or a set of allowed values, the function will filter the [siamcat-class](#) object accordingly.

### Usage

```
select.samples(siamcat, filter, allowed.set = NULL,
              allowed.range = NULL, verbose = 1)
```

### Arguments

|                            |  |
|----------------------------|--|
| <code>siamcat</code>       | an object of class <a href="#">siamcat-class</a>   |
| <code>filter</code>        | string, name of the meta variable on which the selection should be done  |
| <code>allowed.set</code>   | a vector of allowed values   |
| <code>allowed.range</code> | a range of allowed values  |
| <code>verbose</code>       | control output: 0 for no output at all, 1 for only information about progress and success, 2 for normal level of information and 3 for full debug information, defaults to 1 |

**Value**

an object of class [siamcat-class](#) with labels and metadata filtered in order to contain only allowed values

**Examples**

```
data(siamcat_example)
# Select all samples that fall into an Age-range between 20 and 80 years
siamcat_selected <- select.samples(siamcat_example, 'age',
  allowed.range=c(20, 80))

# Select all samples for which information about the gender is given
# Provide additional information with verbose
## Not run: siamcat_selected <- select.samples(siamcat_example, 'gender',
  allowed.set=c(1, 2), verbose=2)
## End(Not run)
```

---

siamcat

*siamcat*

---

**Description**

Function to construct an object of class [siamcat-class](#)

**Usage**

```
siamcat(...)
```

**Arguments**

... list of arguments needed in order to construct a SIAMCAT object

**Details**

Build siamcat-class objects from their components.

**Value**

A new [siamcat-class](#) object

**Examples**

```
# example with package data
fn.in.feats <- system.file('extdata',
  'feat_crc_study-pop-I_N141_tax_profile_mocat_bn_specI_clusters.tsv',
  package = 'SIAMCAT')
fn.in.labels <- system.file('extdata',
  'label_crc_study-pop-I_N141_tax_profile_mocat_bn_specI_clusters.tsv',
  package = 'SIAMCAT')
fn.in.meta <- system.file('extdata',
  'num_metadata_crc_study-pop-I_N141_tax_profile_mocat_bn_specI_clusters.tsv',
  package = 'SIAMCAT')
```

```
feat <- read.features(fn.in.feats)
label <- read.labels(fn.in.labels)
meta <- read.meta(fn.in.meta)
siamcat <- siamcat(feats, labels, meta)
```

---

siamcat-class                    *The S4 class for storing taxa-abundance information and models.*

---

### Description

The S4 class for storing taxa-abundance information and models.

### Slots

phyloseq object of class [phyloseq-class](#)

label an object of class [label-class](#)

orig\_feats an object of class [otu\\_table-class](#)

data\_split an object of class [data\\_split-class](#)

norm\_param a list of normalization parameters, see [normalize.features](#) for more details

model\_list an object of class [model\\_list-class](#)

eval\_data an object of class [eval\\_data-class](#)

pred\_matrix an object of class [pred\\_matrix-class](#)

---

siamcat\_example                    *Documentation for the example siamcat object in the data folder*

---

### Description

Reduced version of the CRC dataset in inst/extdata, containing 100 features (15 associated features at 5% FDR in the original dataset and 85 random other features) and 141 samples, saved after the complete SIAMCAT pipeline has been run. Therefore, contains entries in every siamcat-object slot, e.g. eval\_data or data\_split. Mainly used for running the examples in the function documentation

---

|             |                       |
|-------------|-----------------------|
| train.model | <i>Model training</i> |
|-------------|-----------------------|

---

## Description

This function trains the a machine learning model on the training data

## Usage

```
train.model(siamcat,
method = c("lasso","enet","ridge","lasso_ll", "ridge_ll", "randomForest"),
stratify = TRUE, modsel.crit = list("auc"), min.nonzero.coeff = 1,
param.set = NULL, verbose = 1)
```

## Arguments

|                   |   |
|-------------------|---|
| siamcat           | object of class <a href="#">siamcat-class</a>   |
| method            | string, specifies the type of model to be trained, may be one of these: c('lasso', 'enet', 'ridge',   |
| stratify          | boolean, should the folds in the internal cross-validation be stratified?, defaults to TRUE   |
| modsel.crit       | list, specifies the model selection criterion during internal cross-validation, may contain these: c('auc', 'f1', 'acc', 'pr'), defaults to list('auc')   |
| min.nonzero.coeff | integer number of minimum nonzero coefficients that should be present in the model (only for 'lasso', 'ridge', and 'enet', defaults to 1  |
| param.set         | a list of extra parameters for mlr run, may contain: <ul style="list-style-type: none"> <li>• cost - for lasso_ll and ridge_ll</li> <li>• alpha for enet</li> <li>• ntree and mtry for RandomForrest.</li> </ul> Defaults to NULL |
| verbose           | control output: 0 for no output at all, 1 for only information about progress and success, 2 for normal level of information and 3 for full debug information, defaults to 1  |

## Details

This functions performs the training of the machine learning model and functions as an interface to the mlr-package.

The function expects a [siamcat-class](#)-object with a prepared cross-validation (see [create.data.split](#)) in the `data_split`-slot of the object. It then trains a model for each fold of the `datasplit`.

For the machine learning methods that require additional hyperparameters (e.g. `lasso_ll`), the optimal hyperparameters are tuned with the function [tuneParams](#) within the mlr-package.

The methods 'lasso', 'enet', and 'ridge' are implemented as mlr-taks using the 'classif.cvglmnet' Learner, 'lasso\_ll' and 'ridge\_ll' use the 'classif.LiblineARL1LogReg' and the 'classif.LiblineARL2LogReg' Learners respectively. The 'randomForest' method is implemented via the 'classif.randomForest' Learner.

**Value**

object of class `siamcat-class` with added `model_list`

**Examples**

```
data(siamcat_example)
# simple working example
siamcat_validated <- train.model(siamcat_example, method='lasso')
```

---

`validate.data`*Validate samples in labels, features, and metadata*

---

**Description**

This function checks if labels are available for all samples in features. Additionally validates meta-data, if available.

**Usage**

```
validate.data(siamcat, verbose = 1)
```

**Arguments**

|                      |  |
|----------------------|--|
| <code>siamcat</code> | an object of class <code>siamcat-class</code>  |
| <code>verbose</code> | control output: 0 for no output at all, 1 for only information about progress and success, 2 for normal level of information and 3 for full debug information, defaults to 1 |

**Details**

This function validates the data by checking that labels are available for all samples in the feature matrix. Furthermore, the number of samples per class is checked to ensure a minimum number. If metadata is available, the overlap between labels and metadata is checked as well.

**Value**

an object of class `siamcat-class` with validated data

**Examples**

```
data(siamcat_example)
# simple working example
siamcat_validated <- validate.data(siamcat_example)
```
