Abstract

In this vignette we are going to show how we got the RData *pbcmcData.RData* which can be loaded via the **MIGSAdata** package using data(pbcmcData).

Keywords: singular enrichment analysis, over representation analysis, gene set enrichment analysis, functional class scoring, big omics data.

---

1. Getting the data

Following we give the used code to download this data and their PAM50 subtypes.

```
> library(limma);
> library(pbcmc);
> # datasets included in BioConductor repository
> libNames <- c("mainz", "nki", "transbig", "unt", "upp", "vdx");
> # let's load them!
> pbcmcData <- lapply(libNames, function(actLibName) {
+     print(actLibName);
+
+     # the pbcmc package provides an easy way to download and classify them
+     actLib <- loadBCDataset(Class=PAM50, libname=actLibName, verbose=FALSE);
+     actLibFilt <- filtrate(actLib, verbose=FALSE);
+     actLibFilt <- classify(actLibFilt, std="none", verbose=FALSE);
+     actSubtypes <- classification(actLibFilt)$subtype;
+
+     # get the expression matrix and the annotation
+     actExprs <- exprs(actLib);
+     actAnnot <- annotation(actLib);
+
```

```
+     # we recommend working allways with Entrez IDs, let's match them with
+     # expression matrix rownames (and modify them)
+     if (all(actAnnot$probe == rownames(actExprs))) {
+         actExprs <- actExprs[!is.na(actAnnot$EntrezGene.ID),];
+         actAnnot <- actAnnot[!is.na(actAnnot$EntrezGene.ID),];
+         rownames(actExprs) <- as.character(actAnnot$EntrezGene.ID);
+     } else {
+         matchedEntrez <- match(rownames(actExprs), actAnnot$probe);
+         # all(rownames(actExprs) %in% actAnnot$probe == !is.na(matchedEntrez));
+
+         stopifnot(all(
+             actAnnot$probe[!is.na(matchedEntrez)] ==
+             rownames(actExprs)[!is.na(matchedEntrez)]));
+
+         actExprs <- actExprs[!is.na(matchedEntrez),];
+         actAnnot <- actAnnot[!is.na(matchedEntrez),];
+         stopifnot(all(actAnnot$probe == rownames(actExprs)));
+         actExprs <- actExprs[!is.na(actAnnot$EntrezGene.ID),];
+         actAnnot <- actAnnot[!is.na(actAnnot$EntrezGene.ID),];
+         rownames(actExprs) <- as.character(actAnnot$EntrezGene.ID);
+     }
+
+     # average repeated genes expression
+     actExprs <- avereps(actExprs);
+
+     stopifnot(all(colnames(actExprs) == names(actSubtypes)));
+     # filtrate only these two conditions
+     actExprs <- actExprs[, actSubtypes %in% c("Basal", "LumA")];
+     actSubtypes <- as.character(
+         actSubtypes[actSubtypes %in% c("Basal", "LumA")]);
+
+     return(list(geneExpr=actExprs, subtypes=actSubtypes));
+ })

[1] "mainz"
[1] "nki"
[1] "transbig"
[1] "unt"
[1] "upp"
[1] "vdx"

> names(pbcmcData) <- libNames;
```

And let's check it is the same data.

```
> # save the just created pbcmcData to newPbcmcData
> newPbcmcData <- pbcmcData;
```

```
> library(MIGSAdata);
> # and load the MIGSAdata one.
> data(pbcmcData);
> all.equal(newPbcmcData, pbcmcData);

[1] TRUE
```
