MafH5.gnomAD.v3.1.1.GRCh38-package

Annotation package for minor allele frequency data from the Genome Aggregation Database

Description

This annotation package stores minor allele frequency (MAF) data derived from the whole genome variant set version 3.1.1 of the Genome Aggregation Database (gnomAD). The data are exposed to the user in the form of a [GScores](#) object, named after the package and loaded into main memory only as different chromosomes and populations are being queried. The class definition and methods to access [GScores](#) objects are found in the [GenomicScores](#) software package. To minimize disk space and memory requirements, MAF values larger or equal than 0.1 are stored using two significant digits, while MAF values smaller than 0.1 are stored using one significant digit. MAF data are stored using a HDF5 backend, which minimizes de main memory footprint but whose performance depends on the hard disk drive (HDD) reading performance. For this reason, this packages will perform faster if it is installed in a local HDD rather than in network drive (e.g., through NFS access).

Please consult the gnomAD FAQ page at <http://gnomad.broadinstitute.org/faq> before you use these data for your own research.

Format

[MafH5.gnomAD.v3.1.1.GRCh38](#) [GScores](#) object containing MAF values from gnomAD genomes downloaded on April

Author(s)
